Notes: 1. The results are average values based on random sampling and testing of production lots. Composite materials are not homogeneous; and therefore, the location of the coupon extraction can cause variances in the coupon results. Creative Pultrusions publishes an average value of random samples from production lots.

¹Applies to single nut only; multiple nuts do not yield corresponding results.

²Ultimate strength values are average obtained in design testing.

³Values are based on unthreaded rod.

⁴Torque results are dependent on several variable factors including the lubricant used, the length of stud between nuts, alignment, washer surfaces, etc. Therefore, if such results of torque tightening are important, it is vital that torque limits be determined experimentally for the exact installation conditions.

⁵Appropriate safety factors must be applied.

⁶Properties apply to Superstud!™ used with CP Hex Nut.
